BUILDING TECTONICS

Supervisor: Björn Gross

Examiner: Mikael Ekegren

MT'21

There is no doubt that water has amazing effects on our bodies and minds. It decreases anxiety, expands creativity, and improves our physical and mental wellbeing.

Being such a major source of happiness it is problematic that the city of Gothenburg has a lack of bath facilities and connections to the water, despite being a coastal city.

The citizens' desire to get closer to the water has been approved by the municipality that has decided to build four new swimming facilities in Gothenburg. To create a reasonable distance to a swimming pool for as many citizens as possible, adding activities and recreational environments.

This thesis examines how the design of a building in an urban environment can provide a peaceful and calming space for rehabilitation for the modern and stressed person by focusing on detail, light, and materiality.

The project aims to promote and increase through its design and placement the engagement of the site's social life.

The proposal is a health temple in form of a new bath facility providing the inhabitants of Majorna new encounters & relaxing spaces.

The method used in this thesis is mainly research by design.

Keywords: Bath, Majvallen, public space, water, relaxation, recreation.
